

SOLELY FOR PURPOSES OF FORAGE WORK EXPERIENCE

What I thought would be the features that would affect the model the most.

Mutual Information Scores which shows which features impact the model more.

I trained the data set with a Random forest classifier model using the top 3, 5 and all features. The model that gave the best accuracy and AUC scores was when I used all the features. The metrics were

**ACCURACY: 85.26**

**AUC score: 0.566**
